

Pramaan Evidence Catalog Feature Context

The Evidence Catalog is a centralized module within the Pramaan forensic workstation designed to manage, inspect, and track digital evidence items associated with a case. It serves as the primary hub for examiners to browse acquired media and track their forensic lifecycle.

Key Components Implemented

1. Faceted Filtering & Search (Left Sidebar)

Users can drill down into large evidence sets using multi-dimensional filters:

- **Categories:** Differentiates between raw 'Block Images' (physical acquisitions) and 'Disk Images' (logical acquisitions).
- **Status Tracking:** Filters items by lifecycle states: 'Verified' (hash matched), 'Awaiting Hash' (verification pending), 'Parsing' (extraction in progress), and 'Failed'.
- **Text Search:** A robust text filter to quickly isolate specific evidence files by name.

2. Dual-Mode Catalog Views (Center Pane)

The primary viewing area supports two interchangeable layouts:

- **Grid View:** A visual card-based layout providing quick telemetry: source category icons, file sizes, truncated SHA-256 hashes, and color-coded status badges.
- **List View:** A dense, tabular data table optimized for bulk analysis, showing complete filenames, exact byte sizes, statuses, and full hash strings.

Both views support sorting by 'Recent', 'Size', and 'Name'.

3. Evidence Inspector (Right Sidebar)

When an evidence item is selected from the catalog, this dynamic panel reveals deep forensic metadata:

- **Item Provenance:** Details the acquisition method, format, and physical/logical origin.
- **Chain of Custody:** A filtered ledger showing only the tamper-evident custody events (e.g., acquisition, verification, parsing) specific to the selected item.

4. Global Telemetry Strip (Bottom Footer)

A persistent status bar summarizing the case's aggregate metrics:

- **Storage Bytes:** Total disk footprint of all acquired evidence.
- **Recovered Artifacts:** Total number of video segments extracted from the evidence.
- **Processing Jobs:** Live count of active/running forensic tasks.
- **Audit Errors:** Count of failed jobs requiring examiner intervention.
